Park the car in the right space. And don't forget the passengers!

2 players have to find a space in a car park to park their car full of passengers. Just like in real life, they can only hope their space isn't taken!

Goals

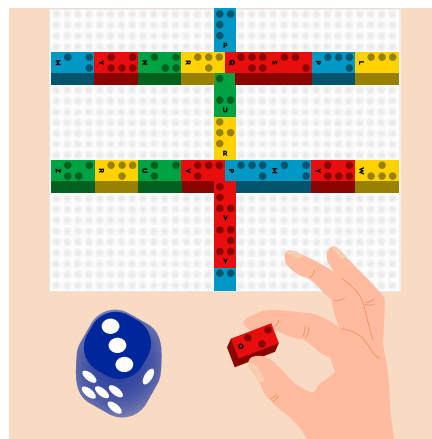

Perform multiple steps to understand how the 6 dots are arranged in a braille cell.

The adult prepares

- 1 baseplate
- All the bricks in the box
- 1 dice

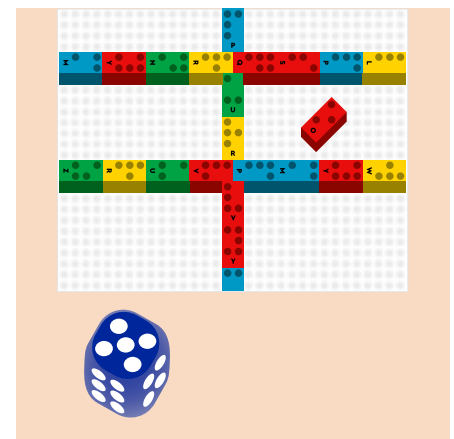

With random bricks, create a 6-car parking lot, 2 columns of 3 spaces, like a braille cell.

The children play

1 The first player throws a dice and reads it: the number corresponds to the number of passengers.

They find a car, i.e. a brick, with as many studs as passengers. If they throw a 6, they throw the dice again.

2 The first player throws the dice again. The number they get gives the identification number of the parking space.

The second player takes their turn. If the space is already occupied, the player puts the car back in the box. The game ends when the entire parking lot is full.

Facilitation tips

- Before playing, show the children that the parking lot is very similar to a braille cell. Name all the parking spaces aloud.
- Change the rules: the children pick a random brick and roll the dice only once, to find the parking space.
